

1 Yoneda Lemma

Definiton 1.1. For any category \mathcal{A} , it's opposite category, \mathcal{A}^{op} is the category having the objects of \mathcal{A} . And for objects $A, B \in \mathcal{A}$, a morphism $f \in \mathcal{A}^{op}(A, B)$ only if there is a morphism $g \in \mathcal{A}(B, A)$.

Proposition 1.1. For a locally small category \mathcal{A} , fixing an object $A \in \mathcal{A}$ gives a functor, $H_A : \mathcal{A}^{op} \rightarrow Set$ defined as:

- (i) For any object $B \in \mathcal{A}$, $H_A(B) := Hom_{Set}(B, A)$
- (ii) For any morphism, $g : X \rightarrow Y$ in \mathcal{A} ,

$$H_A(g) : \mathcal{A}(Y, A) \rightarrow \mathcal{A}(X, A) \text{ is given by } p \mapsto p \circ g$$

Definiton 1.2. For a locally small category \mathcal{A} , the category of presheaves on \mathcal{A} , denoted by $[\mathcal{A}^{op}, Set]$ is defined to have functors from \mathcal{A}^{op} to Set as objects, and natural transformations between them as morphisms.

Lemma 1.2.1. Lemma 1.3.11

Lemma 1.2.2. Exccercise 1.3.29

Theorem 1.1. Yoneda Lemma If \mathcal{A} is a locally small category then, for any object $A \in \mathcal{A}$ and $X \in [\mathcal{A}^{op}, Set]$, there exists an isomorphism,

$$[\mathcal{A}^{op}, Set](H_A, X) \cong X(A) \text{ which is natural in } A \text{ and } X.$$

Notation:

- We denote the category of presheaves on \mathcal{A} by \mathcal{C} .
- For the map $\hat{}$, instead of writing $\hat{}(a)$, we use $\hat{a} = b$ to denote $a \xrightarrow{\hat{}} b$.
- For the map $\tilde{}$, instead of writing $\tilde{}(a)$, we use $\tilde{a} = b$ to denote $a \xrightarrow{\tilde{}} b$.

- $[\mathcal{A}^{op}, Set](H_A, X)$ denotes the collection of morphisms $\alpha : \begin{array}{ccc} & H_A & \\ \alpha \downarrow & & \uparrow \\ & X & \end{array}$.

To prove the theorem, first, we show that $[\mathcal{A}^{op}, Set](H_A, X)$ is isomorphic to $X(A)$ as set, and then that this isomorphism is natural in X and A .

Proof. Let \mathcal{A} be a locally small category. Fix an object $A \in \mathcal{A}$ and a presheaf X on \mathcal{A} .

I Showing isomorphism between $[\mathcal{A}^{op}, Set](H_A, X)$ and $X(A)$

Define $\hat{} : \mathcal{C}(H_A, X) \rightarrow X(A)$ for any $\alpha : H_A \rightarrow X$, as $\hat{\alpha} := \alpha_A(1_A)$. As $1_A \in Hom_{Set}(A, A) = H_A(A)$, definition of α_A gives that $\alpha_A(1_A) \in X(A)$

Define $\tilde{} : X(A) \rightarrow [\mathcal{A}^{op}, Set](H_A, X)$ for any $x \in X(A)$ as the natural transformation $\tilde{x} : H_A \rightarrow X$ whose K -component is the function mapping each morphism $p \in \mathcal{A}(K, A)$ to $(X(p))(x)$. That is, $\tilde{x}_K(p) := (X(p))(x)$.

We are going to show that \tilde{x} is a natural transformation. Fix objects $K, L \in \mathcal{A}$ and morphism $q \in \mathcal{A}^{op}(K, L)$.

$$\text{Need to show that the square } \begin{array}{ccc} H_A(K) & \xrightarrow{H_A(q)} & H_A(L) \\ \tilde{x}_K \downarrow & & \downarrow \tilde{x}_L \\ X(K) & \xrightarrow{X(q)} & X(L) \end{array} \text{, that is } \begin{array}{ccc} \mathcal{A}(K, A) & \xrightarrow{- \circ q} & \mathcal{A}(L, A) \\ \tilde{x}_K \downarrow & & \downarrow \tilde{x}_L \\ X(K) & \xrightarrow{X(q)} & X(L) \end{array} \text{ commutes .}$$

So, for any $f : K \rightarrow A$, need that $\tilde{x}_L(f \circ q) = X(q) \circ \tilde{x}_K(f)$. Using the definition of \tilde{x} gives the following.

$$\begin{aligned} LHS &= \tilde{x}_L(f \circ q) = (X(f \circ q))(x) \\ RHS &= X(q) \circ \tilde{x}_K(f) = (X(q))(X(f)(x)) = (X(q) \circ X(f))(x) \end{aligned}$$

And as X is a contravariant functor, $X(f \circ q) = X(q) \circ X(f)$, giving that LHS=RHS. Now going to show that $\hat{}$ and $\tilde{}$ define an isomorphism. Need to show that $\hat{}$ and $\tilde{}$ are mutually inverse.

- (i) For any $x \in X(A)$, $\hat{x} = \tilde{x}_A(1_A) = (X(1_A))(x) = 1_{X(A)}(x) = x$.
- (ii) For any $\alpha \in \mathcal{C}(H_A, X)$, need to show that $\hat{\alpha} = \alpha$. So, it's required that each of their component are equal. As both $\hat{\alpha}$ and α are natural transformations between functors that go to the category *Set*, each of the components is a function. So, need to show that for any $f \in \mathcal{A}(K, A) = H_A(K)$, $(\hat{\alpha})_K(f) = \alpha_K(f)$. Using first the definition of \sim and then that of $\hat{\alpha}$ gives:

$$LHS = \hat{\alpha}_B(f) = (X(f))(\hat{\alpha}) = (X(f))(\alpha_A(1_A)) \quad (1)$$

And as $f \in \mathcal{A}(K, A)$, we also have the following.

$$RHS = \alpha_K(f) = \alpha_K(1_A \circ f) \quad (2)$$

Because α is a natural transformation, the square following square commutes for 1_A .

$$\begin{array}{ccc} \mathcal{A}(A, A) & \xrightarrow{- \circ f} & \mathcal{A}(K, A) \\ \alpha_A \downarrow & & \downarrow \alpha_K \\ X(A) & \xrightarrow{X(f)} & X(K) \end{array}$$

This gives that $\alpha_K(1_A \circ f) = (X(f))(\alpha_A(1_A))$. Hence, we have from (1) and (2), we get that $RHS = LHS$.

II Showing naturality of this isomorphism

By Using Lemma 1.2.1, it's enough to show that $\hat{\cdot}$ is natural in A for any choice of X , and that it is natural in X for any A .

- (i) We are going to show naturality in X . Fix any $A \in \mathcal{A}$. Need that for presheaves $X, Y \in \mathcal{C}$ and natural transformation $\beta \in \mathcal{C}(X, Y)$, the following square commutes.

$$\begin{array}{ccc} \mathcal{C}(H_A, X) & \xrightarrow{\beta \circ -} & \mathcal{C}(H_A, Y) \\ \hat{\cdot} \downarrow & & \downarrow \hat{\cdot} \\ X(A) & \xrightarrow{\beta_A} & Y(A) \end{array}$$

So, for any $\alpha : H_A \rightarrow X$, we need that $(\hat{\cdot} \circ H_\beta)(\alpha) = (\beta_A \circ \hat{\cdot})(\alpha)$. Using definition of H_β and $\hat{\cdot}$ gives:

$$LHS = (\hat{\cdot} \circ H_\beta)(\alpha) = \widehat{(H_\beta(\alpha))} = \widehat{(\beta \circ \alpha)} = (\beta \circ \alpha)_A(1_A) \quad (3)$$

$$RHS = (\beta_A \circ \hat{\cdot})(\alpha) = \beta_A(\hat{\alpha}) = (\beta_A \circ \alpha_A)(1_A) \quad (4)$$

As $\alpha \in \mathcal{C}(H_A, X)$ and $\beta \in \mathcal{C}(X, Y)$ are morphisms in \mathcal{C} , composition in \mathcal{C} gives $(\beta \circ \alpha)_A = \beta_A \circ \alpha_A$. From (3) and (4), we directly get that $RHS = LHS$.

- (ii) We are going to show naturality in A . Fix any $X \in \mathcal{C}$. Need that for objects $A, B \in \mathcal{A}$ and morphism $f \in \mathcal{A}^{op}(A, B)$, the following square commutes.

$$\begin{array}{ccc} \mathcal{C}(H_A, X) & \xrightarrow{- \circ H_f} & \mathcal{C}(H_B, Y) \\ \hat{\cdot} \downarrow & & \downarrow \hat{\cdot} \\ X(A) & \xrightarrow{X(f)} & X(B) \end{array}$$

So, for any $\alpha : H_A \rightarrow X$, we need that $(\hat{\cdot} \circ H_f)(\alpha) = ((X(f)) \circ \hat{\cdot})(\alpha)$. Using definition of H_f and $\hat{\cdot}$, we get:

$$LHS = (\hat{\cdot} \circ H_f)(\alpha) = \widehat{\alpha \circ H_f} = (\alpha \circ H_f)_B(1_B) = \alpha_B(f \circ 1_B) = \alpha_B(1_A \circ f) \quad (5)$$

$$RHS = ((X(f)) \circ \hat{\cdot})(\alpha) = (X(f))(\hat{\alpha}) = (X(f))(\alpha_A(1_A)) \quad (6)$$

The last equality in (5) is justified because the morphism f goes from B to A in \mathcal{A} . By using equality of (1) and (2) from I(i), for $f \in \mathcal{A}(B, A)$, we get that $(X(f))(\alpha_A(1_A)) = \alpha_B(1_A \circ f)$. Hence, $RHS = LHS$.

□

1.1 Cayley's Theorem

Informally, given a locally small category \mathcal{A} , we can fix a presheaf X on \mathcal{A} , and for any object $A \in \mathcal{A}$, study the set $X(A)$ and gain information about all possible natural transformations between H_A and X . Moreover, by part I(ii) of the proof of Yoneda Lemma, each of the natural transformations is determined by its action on the identity morphisms in \mathcal{A} . Thus, no matter how complicated \mathcal{A} is, if we choose X carefully, we can hope to understand the structure of \mathcal{A} by looking at how $X(A)$ changes as we vary the chosen presheaf and object.

In group theory, Cayley's theorem says every group G is isomorphic to a subgroup of the symmetric group on G . Thus, instead of having to study a complicated group directly, we can study a subgroup of the symmetric group on it.

Cayley's theorem and Yoneda Lemma are similar in the sense that both allow us to change the environment that we study in by putting few restrictions on what we are allowed to study. Cayley allows us to change setting for groups, and Yoneda does that for locally small categories.

Also, as groups themselves can be considered as small categories, we can apply Yoneda Lemma to any group. And in fact, we can get Cayley's theorem as a consequence of Yoneda Lemma by a suitable choice of X and A .

Definiton 1.3 (Symmetric group on a set). Symmetric group on a set is the set of all bijections on X , with the binary operation defined as composition of bijections.

Theorem 1.2. Cayley's Theorem Every group, (G, \cdot) is isomorphic to a subgroup of symmetric group on G .

Proof. Let a group G be given. Define category \mathcal{A}^{op} as having: \star as it's only object, one morphism for each element of G and composition being as elements of G . Thus, by definition of \mathcal{A}^{op} , $G \cong \text{Hom}_{\mathcal{A}^{op}}(\star, \star)$. And using the definition of $H_\star(\star)$, we get that $G \cong H_\star(\star)$.

As G is a group, \mathcal{A}^{op} becomes a locally small category. Using Yoneda Lemma, for $\star \in \mathcal{A}^{op}$ and functor H_\star , we get

$$[\mathcal{A}^{op}, \text{Set}](H_\star, H_\star) \cong H_\star(\star, \star) \cong G.$$

where the above isomorphisms are as sets. □

1.2 Embedding of a category in Presheaf category

Definiton 1.4 (Embedding of a category). A category, \mathcal{A} is said to be embedded in a category, \mathcal{B} if there exists a functor $F : \mathcal{A} \rightarrow \mathcal{B}$ such that F is full, faithful and injective (on objects).

2 Prorelations

Definiton 2.1. A prorelation is a partially ordered, down-directed, up-set of relations $X \rightarrow Y$. That is, $P \subseteq \mathcal{P}(X \times Y)$ is a prorelation if it satisfies the following conditions:

- (i) Partial Order: Containment of relations defines a partial order. That is, $r \subseteq s$ meaning that for any $(x, y) \in X \times Y$, if $(x, y) \in r$ then $(x, y) \in s$.
- (ii) Down-directed: For any $r, s \in P$, there exists $t \in P$ such that $t \subseteq r$ and $t \subseteq s$.
- (iii) Up-set: For any relation $u : X \rightarrow Y$, if there exists $p \in P$ such that $p \subseteq u$ then $u \in P$.

Definiton 2.2. A prorelation $P : X \rightarrow Y$ can be composed to a prorelation $Q : Y \rightarrow Z$ by taking composition of the relations belonging to them. Then, the set $Q.P$ is defined as $Q.P = \{q \circ p : p \in P \text{ and } q \in Q\}$.

Lemma 2.2.1. Composition of two prorelations is a prorelation.

Proof. For prorelations $P : X \rightarrow Y$ and $Q : Y \rightarrow Z$, need to show that $Q.P$ is a prorelation.

- (i) (Partial Order) Inclusion of relations gives a partial order.
- (ii) (Down-Directed) If $k, k' \in Q.P$, then $k = q \circ p$ and $k' = q' \circ p'$ for some $q, q' \in Q$ and $p, p' \in P$. Because Q and P are prorelations, and hence down-directed sets there exists, $a \in Q$ such that $a \subseteq q, q'$ and $b \in P$ such that $b \subseteq p, p'$. Thus, giving an element, $a \circ b$ of $Q.P$ such that $a \circ b \subseteq k, k'$.
- (iii) (Up-Set) Let $l : X \rightarrow Z$ be a relation, and $k \in Q.P$ such that $l \supseteq k$. Define relations $p : X \rightarrow Y$ and $q : Y \rightarrow Z$ as, $p = \{(x, y) : x \in \text{domain}(l) \text{ and } y \in Y\}$ and $q = \{(y, z) : y \in Y \text{ and } z \in \text{range}(l)\}$. Because $k \in Q.P$, there exist $q' \in Q$ and $p' \in P$ such that $k = q' \circ p'$. Thus by definition of p and q , we get that $p \supseteq p'$ and $q \supseteq q'$. Hence $p \in P$ and $q \in Q$ because P and Q are up-sets, which gives us that $q \circ p \in Q.P$. For any $(x, z) \in l$, by definition of p and q , we get that for every $y \in Y$, $(x, y) \in p$ and $(y, z) \in q$. By definition of composition, this gives that $(x, z) \in q \circ p$, giving that $l \subseteq q \circ p$. And, by definition of $q \circ p$ we get that $l \supseteq q \circ p$. Finally giving that $l = q \circ p \in Q.P$.

□

Definiton 2.3. For prorelations $P, Q : X \rightarrow Y$, if every relation in Q is contained inside some relation in P , then P is said to be contained in Q . That is $P \leq Q$ only if $\forall q \in Q, \exists p \in P$ such that $p \subseteq q$.

Definiton 2.4. For a relation $r : X \rightarrow Y$, it's opposite relation $r^o : Y \rightarrow X$ is defined as

$$\forall (x, y) \in X \times Y, (y, x) \in r^o \text{ only if } (x, y) \in r.$$

Lemma 2.4.1. For any function $f : X \rightarrow Y$, Δ_X is contained in the composition $f^o \circ f$.

Proof. As f is a function, it must be defined on every element of it's domain. Thus, for every $x \in X$, there exists some (x, y) in f . By definition of f^o , (y, x) is in f^o . Hence, by definition of composition, (x, x) is in $f^o \circ f$. □

Lemma 2.4.2. For any relation $r : X \rightarrow Y$, the composition $r \circ r^o$ contains $\subseteq \Delta_Y$.

Proof. Suppose there exist $x \in X$ and $y \in Y$ such that xry . By definition of r^o , this gives us that yr^ox . Using definition of composition, yr^oxry gives that $y(r \circ r^o)y$. □

Lemma 2.4.3. For relations $r, s : X \rightarrow Y$ and $t : Y \rightarrow Z$, if $r \subseteq s$ then $(t \circ r) \subseteq (t \circ s)$.

Proof. Suppose relations r, s and t are as given above, and let $x(tr)z$. By definition of composition, there exists, $y \in Y$ such that xry and ytz . Using the hypothesis, as $r \subseteq s$, xry gives xsy . And via composition of xsy with ytz , we get $x(tsz)z$. We started with any element of $(t \circ r)$ and showed that it must also be in $t \circ s$ and thus have that $(t \circ r) \subseteq (t \circ s)$. □

Lemma 2.4.4. For relations $r : X \rightarrow Y$ and $s, t : Y \rightarrow Z$, if $s \subseteq t$ then $(s \circ r) \subseteq (t \circ r)$.

Proof. Suppose relations r, s and t are as given above, and let $x(sr)z$. By definition of composition of relations, we get that there exists some $y \in Y$ such that xry and ysz . Because $s \subseteq t$, ysz implies that ytz . Taking the composition, $xrysz$ yields $x(tr)z$. We started with any element of $(s \circ r)$ and showed that it must also be in $t \circ r$ and thus have that $(s \circ r) \subseteq (t \circ r)$. □

3 Propositions

Definiton 3.1. A function, $f : (X, A) \rightarrow (Y, B)$ is said to be uniformly continuous if $f.A \leq B.f$. That is, for each

$$b \in B, \text{ there exists } a \in A \text{ such that } f \circ a \subseteq b \circ f. \text{ Meaning that } \begin{array}{ccc} X & \xrightarrow{f} & Y \\ A \downarrow & \leq & \downarrow B \\ X & \xrightarrow{f} & Y \end{array}$$

Definiton 3.2. A prorelation on a set, $P : X \rightarrow X$ is a quasi-uniformity if it satisfies the following conditions:

- (i) Every relation in P is reflexive. That is, for each $p \in P$, if $x \in X$ then $(x, x) \in p$.
- (ii) For each p in P , there exists p' in P such that $p' \circ p' \subseteq p$.

Definiton 3.3. If X is a set, and A is a quasi-uniformity on X , then (X, A) is a quasi-uniform space.

Lemma 3.3.1. If A is a quasi-uniformity on a set X , then $A.A = A$

Proof. Fix any $a \in A$, as A is a quasi-uniformity, $\exists b \in A : bb \subseteq a$, we get that $A.A \leq A$. And as A is a prorelation, and is hence down-directed, $\exists c \in A : a.a \supseteq c$, giving that $A.A \geq A$ \square

Proposition 3.1. QUnif is a category defined as having quasi-uniform spaces as objects, and uniformly continuous maps between them as morphisms, with composition defined as that of functions.

Proof. (i) (Associativity) The composition of functions is associative by definition.

- (ii) (Identity) For each object (X, A) , define it's identity to be the identity function $\Delta_X : (X, A) \rightarrow (X, A)$. This function is uniformly continuous as $\Delta_X.A = A \leq A = A.\Delta_X$. \square

Definiton 3.4. A prorelation, $\phi : X \multimap Y$ is called a promodule $\phi : (X, A) \multimap (Y, B)$ if it satisfies:

$$\phi.A \leq \phi \text{ and } B.\phi \leq \phi$$

Definiton 3.5. Containment of promodules is defined as that of prorelations.

Definiton 3.6. Promodules are composed as prorelations.

Proposition 3.2. ProMod is a 2-category defined as having quasi-uniform spaces as its 0-cells, promodules as 1-cells and containment of promodules as 2-cells.

Proof. In order to show that ProMod is a 2-category, need the following:

- (a) (1-Identities) For each quasi-uniform space (X, A) , define $A : (X, A) \multimap (X, A)$ to be the identity 1-cell for (X, A) . A is a promodule because $A.A = A$ (Lemma 2.2.1)
- (b) (1-Composition) Need promodules to be closed under composition.
Let $\phi : (X, A) \multimap (Y, B)$ and $\psi : (Y, B) \multimap (Z, C)$ be promodules. To show that $\psi.\phi : (X, A) \multimap (Z, C)$ is a promodule, need it to be a prorelation that satisfies the two conditions required to be a promodule:
 - (i) By Lemma 1.2.1, prorelations are closed under composition. Hence, $\psi.\phi$ is a prorelation
 - (ii) Need to show that $\psi.\phi.A \leq \psi.\phi$. So, Fix $p \in \psi$ and $q \in \phi$. As ϕ is a promodule, $\phi.A \leq \phi$ gives that there exists $q' \in \phi$ and $a \in A$ such that $q'a \subseteq q$. Thus, $pq'a \subseteq pq$.
 - (iii) Need to show that $C.\psi.\phi \leq \psi.\phi$. Fix $p \in \psi$ and $q \in \phi$. Because ψ is a promodule, $C.\psi \leq \psi$ gives that there exists $c \in C$ and $p' \in \psi$ such that $cp' \subseteq p$. Thus, $cp'q \subseteq pq$
- (c) (2-Identities) As every promodule is contained in itself, always have $\psi \leq \psi$. Define this comparison to be the identity 2-cell for ψ and denote it by \leq_ψ
- (d) (Vertical 2-composition) For promodules $\psi, \phi, \delta : (X, A) \multimap (Y, B)$, if there is a 2-cell from ψ to ϕ and another one from ϕ to δ i.e. $\psi \leq \phi \leq \delta$, then by transitivity of the partial order, $\psi \leq \delta$ i.e. there's a 2-cell from ψ to δ .
- (e) (Horizontal 2-composition) If there are promodules $\psi, \psi' : (X, A) \multimap (Y, B)$ and $\phi, \phi' : (Y, B) \multimap (Z, C)$ such that $\psi \leq \psi'$ and $\phi \leq \phi'$, need to show that $\psi.\phi \leq \psi'.\phi'$. Fix $p' \in \psi'$ and $q' \in \phi'$. As $\psi \leq \psi'$, $\exists p \in \psi : p \subseteq p'$ and as $\phi \leq \phi'$, $\exists q \in \phi : q \subseteq q'$. Thus, $pq \subseteq p'q'$

- (f) (1-Identity) Need to show that for any promodule $\phi : (X, A) \rightharpoonup (Y, B)$, $\phi.A = \phi = B.\phi$. By quasi-uniformity of A , every $a \in A$, is reflexive. Thus, for any $p \in \phi$ and $a \in A$, $p = p.\Delta_X \subseteq p a$ giving that $\phi \leq \phi.A$. And as ϕ is a promodule, $\phi \geq \phi.A$. Hence, by anti-symmetry of the partial order, $\phi = \phi.A$.
Similarly, By quasi-uniformity of B , every $b \in B$, is reflexive. Thus, for any $p \in \phi$ and $b \in B$, $p = \Delta_Y.p \subseteq b p$ giving that $\phi \leq B.\phi$. And as ϕ is a promodule, $\phi \geq B.\phi$. Hence, $\phi = B.\phi$.
- (g) (1-Associativity) As composition of relations is associative, so too is the composition of prrelations directly giving that composition of promodules i.e. 1-cells is associative.
- (h) (Vertical 2-Identity) Let $\leq : \psi \rightarrow \phi$ be a 2-cell i.e. $\psi \leq \phi$. By our definition of identity 2-cell, $\leq_\psi \cdot \leq_1$ means precisely that $\psi \leq \psi \leq \phi$, and by transitivity, this is equivalent to $\psi \leq \phi$. Similarly, $\leq_1 \cdot \leq_\phi$ means exactly that $\psi \leq \phi \leq \phi$, and this is equivalent to $\psi \leq \phi$.
- (i) (Vertical 2-Associativity) Associativity of the partial order on promodules directly gives the associativity of composition of 2-cells in ProMod.
- (j) (Horizontal 2-Identity) Let $\psi, \phi : (X, A) \rightharpoonup (Y, B)$ be promodules. For any 2-cell $\leq : \psi \rightarrow \phi$, need to show that the 2-cell given by the horizontal composition, $\leq * \leq_A$ is equal to \leq , as well as equal to $\leq_B * \leq$. So, it's required that $\psi.A \leq \phi.A \iff \psi \leq \phi \iff B.\psi \leq B.\phi$. And this holds as a direct consequence of (f).
- (k) (Horizontal 2-Associativity) As there's a unique 2-cell between any two promodules, and composition of promodules is associative, horizontal composition of 2-cells is associative.
- (l) (2-Identity) For promodules $\psi : (X, A) \rightharpoonup (Y, B)$ and $\phi : (Y, B) \rightharpoonup (Z, C)$ need $(\leq_\psi * \leq_\phi) = \leq_{\psi.\phi}$. Both sides of the required equality are 2-cells $\leq : \psi.\phi \rightarrow \psi.\phi$. Thus, they are equal by the uniqueness of 2-cells between any two 1-cells.
- (m) (2-Interchange) Let $\psi, \phi, \delta : (X, A) \rightharpoonup (Y, B)$ and $\psi', \phi', \delta' : (Y, B) \rightharpoonup (Z, C)$ be promodules. For 2-cells $\leq_1 : \psi \rightarrow \phi, \leq_2 : \phi \rightarrow \delta, \leq_a : \psi' \rightarrow \phi'$ and $\leq_b : \phi' \rightarrow \delta'$, need to show $(\leq_b \cdot \leq_a) * (\leq_2 \cdot \leq_1) = (\leq_b * \leq_2) \cdot (\leq_a * \leq_1)$. Both RHS and LHS are 2-cells from $\psi.\psi'$ to $\delta.\delta'$ and are hence equal.

□

Proposition 3.3. Functor, $(-)_* : \text{QUnif} \rightarrow \text{ProMod}$ is defined as fixing quasi-uniform spaces (objects) and taking uniformly continuous functions (morphisms) to the it's pre-composition with it's domain space's identity(promodule) i.e.

- (a) for $(X, A) \in \text{QUnif}$, $(X, A)_* := (X, A) \in \text{ProMod}$
(b) for $f : (X, A) \rightarrow (Y, B)$ in QUnif , $f_* := B.f$

Proof. We will first show that $B.f = b \circ f : b \in B$ is a promodule, and then that $(-)_*$ defines a functor.

- (i) (Partial-Order) Inclusion of relations acts as the partial order.
- (ii) (Down-Directed) Fix any k, k' belonging to $B.f$. Thus, there exist b, b' in B such that $k = b f$ and $k' = b' f$. Using down-directedness of B , there exists a $c \in B$ such that $c \subseteq b, b'$. Hence, by Lemma 2.4.4, $c f \subseteq k, k'$.
- (iii) (Up-set) Let k belong to $B.f$ and $l : (X, A) \rightarrow (Y, B)$ be a uniformly continous function such that $l \supseteq k$. Define a relation $b' := \{(f(d), l(d)) : d \in \text{domain}(l)\}$. By definition, for any $x \in X$ and $z \in Y$ such that $(x, z) \in l$, we get that $(f(x), z) \in b'$. And $l \supseteq k = b f$ implies $\text{domain}(l) \supseteq \text{domain}(f)$ giving $(x, f(x)) \in f$. Thus, by definiition of composition, $(x, z) \in b'.f$. Conversely, suppose $(x, z) \in b'.f$. By definition of composition, there exists $f(x) \in Y$ such that $(f(x), z) \in b'$. Again using the definition of b' , we get that $z = l(x)$ i.e. $(x, z) \in l$. Hence, $l = b' f$. Now we will show that $b' \supseteq b$. Because $b' f = l \supseteq k = b f$, for any $x \in X$ we have that $b'(f(x)) \supseteq b(f(x))$. Thus, $b'|_{f(x)} \supseteq b|_{f(x)}$. By down-directedness of B , the restriction $b|_{f(x)} \subseteq b$ implies $b|_{f(x)} \subseteq b|_{f(x)}$. Finally, $b' \supseteq b|_{f(x)} \supseteq b|_{f(x)}$ gives $b' \in B$. Hence, $b'.f \in B.f$.
- (iv) Need to show that $(B.f).A \leq B.f$. So, fix any $b \in B$, we will find $b' \in B$ and $a \in A$ such that $b' f a \subseteq b f$. By quasi-uniformity of B , there exists $b' \in B$ such that $b' b' \subseteq b$. Using Lemma 2.4.3, we get that $b' b' f \subseteq b f$. As f is uniformly continous, $f.A \leq B.f$ gives that there is some $a \in A$ such that $f a \subseteq b' f$. Using this in the previous inequality, we get $b' f a \subseteq b' b' f \subseteq b f$.
- (v) Need to show that $B.B.f \leq B.f$. Fix any $b \in B$, we will find $b' \in B$ such that $b' b' f \subseteq b f$. By quasi-uniformity of B , there exists $b \in B$ such that $b' b' \subseteq b$. Using Lemma 2.4.4, we get $b' b' f \subseteq b f$.

Thus, $B.f$ is a promodule. Going to show that $(-)_*$ defines a functor:

- (i) (Composition) Need to show that $(g \circ f)_* = g_* f_*$ i.e. $C.g.f = C.g.B.f$.

In order to show $C.g.f \leq C.g.B.f$, fix any $b \in B, c \in C$. We will show that $c g f \subseteq c g b f$. As f is uniformly continuous, $f.A \leq B.f$ gives that there exists $a \in A$ such that $f a \subseteq b f$. Using Lemma 2.4.3, we get $(c g) f a \subseteq (c g) b f$. Now, using reflexivity of a , we get $c g f \subseteq c g b f$.

Now, to show that $C.g.f \geq C.g.B.f$. Fix any $c \in X$, we will find $c' \in C$ and $b \in B$ such that $c g f \supseteq c g b f$. By quasi-uniformity of C , there exists $c' \in C$ such that $c \subseteq c' c'$. Using Lemma 2.4.4 gives that $c(g f) \supseteq c' c'(g f)$. Because g is uniformly continuous, $C.g \geq g.B$ gives us $b \in B$ such that $g c' \supseteq b g$. Using this in the previous inequality gives that $c g f \supseteq c' g b f$.

- (ii) (Identity) let (X, A) be in object of QUnif and $1_{(X,A)} : (X, A) \rightarrow (X, A)$ be the identity funtion on (X, A) . That is, $1_{(X,A)}$ is defined as $x \mapsto x$. Need to show that $(1_{(X,A)})_* = 1_{(X,A)_*}$. Using functor's definition, $LHS = (1_{(X,A)})_* = A.(1_{(X,A)}) = A.1_{(X,A)} = A$ and $RHS = 1_{(X,A)_*} = 1_{(X,A)}$ Using Proposition 3.2(f), we get that $A = 1_{(X,A)} = RHS$.

□

Proposition 3.4. Functor, $(-)^* : \text{QUnif}^{op} \rightarrow \text{ProMod}$ is defined as fixing quasi-uniform spaces and taking uniformly continuous functions to the composition of their opposite relation with it's domain space's identity i.e.

- (a) for $(X, A) \in \text{QUnif}^{op}$, $(X, A)^* := (X, A) \in \text{ProMod}$

- (b) for $f : (X, A) \rightarrow (Y, B)$ in QUnif , $f^* := f^o.B$

Proof. Showing that $f^o.B : (Y, B) \rightarrow (X, A)$ is a promodule.

So, need to show $f^o.B$ a prorelation $Y \rightarrow X$ and that $(f^o.B).B \subseteq f^o.B$ and $A.(f^o.B) \subseteq f^o.B$

To show prorelation,

- (i) (Partial-order) Inclusion of relations i.e. for $k = f^o \circ b$ and $k' = f^o \circ b'$ in $f^o.B$, $k \subseteq k' \iff b \subseteq b'$

- (ii) (Down directed) for $k, k' \in f^o.B$, need that $\exists l \in f^o.B$ such that $l \subseteq k, k'$

Fix $k, k' \in f^o.B \implies \exists b, b' \in B : k = f^o \circ b$ and $k' = f^o \circ b'$

By down-directedness of B , there exists $c \in B$ such that $c \subseteq b, b'$, define $l = f^o \circ c$. Now, using Lemma 2.4.3 gives $l = f^o \circ c \subseteq k, k'$.

- (iii) (Up-set) for a relation $l : Y \rightarrow X$ and $k \in f^o.B$ such that $l \supseteq k$, need $l \in f^o.B$

Let $b \in B$ be such that $k = f^o \circ b$ and define $b' := \{(y, y') : y \in \text{domain}(l) \text{ and } y' \in (f^o)^{-1}(l(y))\}$

As $l \supseteq k = f^o \circ b$, $\text{domain}(b') = \text{domain}(l) \supseteq \text{domain}(b)$

and $\text{range}(l) \supseteq \text{range}(f^o \circ b) \implies \forall y \in \text{domain}(b), \text{range}(b') = (f^o)^{-1}(l(y)) \supseteq (f^o)^{-1}(f^o \circ b) = \text{range}(b)$

Now, by definition of b' , $f^o \circ b' \supseteq l$. To show $f^o \circ b \subseteq l$,

$(x, y) \in f^o \circ b' \implies \exists z \in Y : (x, z) \in b' \text{ and } (z, y) \in f^o \implies x \in \text{domain}(l) \text{ and } z \in l(x) \text{ i.e. } (x, z) \in l$

To show $(f^o.B).B \leq f^o.B$, need that $\forall b \in B, \exists b' \in B : f^o \circ b' \circ b' \subseteq f^o \circ b$,

Fix any $b \in B$, as B is a quasi-uniformity, $\exists b' \in B : b' \circ b' \subseteq b \implies f^o \circ b' \circ b' \subseteq f^o \circ b$

To show $A.(f^o.B) \leq f^o.B$, need that $\forall b \in B, \exists b' \in B, a \in A : a \circ f^o \circ b' \subseteq f^o \circ b$,

As f is uniformly continuous, $f.A \leq B.f$ i.e. $\forall b \in B, \exists a \in A : f \circ a \subseteq b \circ f \implies a = f^o \circ f \circ a \subseteq f^o \circ b \circ f$

Fix any $b \in B$, so, $\exists b' \in B : b' b' \subseteq b$ And, for this b' , $\exists a : a \subseteq f^o b' f \implies a f^o b' \subseteq f^o b' f f^o b' \subseteq f^o b' b' \subseteq f^o b \implies a f^o b' \subseteq f^o b$

Now, need to show that $(-)^*$ respects composition and identity.

- (i) (Composition) let f, g be uniformly continuous, $(X, A) \xrightarrow{f} (Y, B) \xrightarrow{g} (Z, C)$ need that $(g \circ f)^* = f^*.g^*$

$LHS = (g \circ f)^* = (g \circ f)^o.C = (f^o \circ g^o).C$ and $RHS = f^*.g^* = (f^o.B).(g^o.C)$

For equality, showing that $LHS \geq RHS$ and $LHS \leq RHS$:

To show $(f^o \circ g^o).C \geq (f^o.B).(g^o.C)$, need that $\forall c \in C, \exists b \in B, c' \in C : f^o g^o c \supseteq f^o b g^o c'$

Fix any $c \in C$, so, $\exists c' \in C : c' \circ c' \subseteq c \implies f^o g^o c \supseteq f^o g^o (c' c') = f^o g^o (c' \Delta_Z c') \supseteq f^o g^o c' (g g^o) c'$

By uniform continuity of g , for $c' \in C, \exists b \in B : g b \subseteq c' g$

Thus, $f^o g^o c \supseteq f^o g^o (c' g) g^o c' \supseteq f^o (g^o g) b g^o c' = f^o b g^o c'$.

To show $(f^o \circ g^o).C \leq (f^o.B).(g^o.C)$, need that $\forall b \in B, c \in C, \exists c' \in C : f^o g^o c \subseteq f^o b g^o c'$

Fix any $c \in C, b \in B$ will show that $c' := c$ works:

As B is a quasi-uniformity, $\Delta_Y \subseteq b \implies f^o \Delta_Y g^o c = f^o g^o c \subseteq f^o b g^o c = f^o b g^o c'$

- (ii) (Identity) let $(X, A) \in \text{QUnif}^{op}$, and $1_{(X,A)} : (X, A) \rightarrow (X, A)$ as $x \mapsto x$ need that $(1_{(X,A)})^* = 1_{(X,A)^*}$

$LHS = (1_{(X,A)})^* = (1_{(X,A)})^o.A = 1_{(X,A)}.A = A$.

And as $RHS = 1_{(X,A)^*} = 1_{(X,A)}$ Using Proposition 3.2(f), we get that $A = 1_{(X,A)} = RHS$.

Definiton 3.7. Let $f : (X, A) \rightarrow (Y, B)$ be a uniformly continuous function.

I f is said to be fully faithful if $f^*.f_* = A$

II f is said to be fully dense if $f_*.f^* = B$

Proposition 3.5. Fix a uniformly continuous map, $f : (X, A) \rightarrow (Y, B)$

- (a) f is fully faithful if and only if $A \geq f^o.B.f$
- (b) f is fully dense if and only if for any $b \in B$, $\exists b' \in B$ such that $b' \subseteq b f f^o b$
- (c) f is topologically dense if and only if for any $b \in B$, $b f f^o b$ is reflexive
- (d) f is fully dense if and only if f is topologically dense

Proof.

- (a) (i) (\implies) Let f be fully faithful i.e. $f^*.f_* = A \implies f^o.B.B.f = A$
 Need to show that $A = f^o.B.f$ i.e. $A \leq f^o.B.f$ and $A \geq f^o.B.f$
 By hypothesis and quasi-uniformity of B , $A \geq f^o.B.B.f \geq f^o.B.f$
 To show $A \leq f^o.B.f$, need that $\forall b \in B, \exists a \in A : a \subseteq f^o b f$
 Fix $b \in B$, hypothesis gives that $f^o.B.B.f \leq A$ so,
 $\exists a \in A : a \subseteq f^o b b f$ and also, by quasi-uniformity of B , for $b, \exists b' \in B : b' b' \subseteq b \implies f^o b' b' f \subseteq f^o b f$
 Combining the above two inequalities, $a \subseteq f^o b b f \subseteq f^o b f$
- (ii) (\impliedby) Let $A = f^o.B.f$ need to show $A = f^o.B.B.f$ i.e. $A \geq f^o.B.B.f$ and $A \leq f^o.B.B.f$
 To show $A \geq f^o.B.B.f$, need to show that $\forall a \in A, \exists b, b' \in B : a \supseteq f^o b b' f$
 Have that $A \geq f^o.B.f$ and $B.B \leq B$
 So, fix $a \in A$, now $\exists b \in B : a \subseteq f^o b f$ and for this b , $\exists b' \in B : b' b' \subseteq b$. Therefore, $a \supseteq f^o b f \supseteq f^o b' b' f$
 To show $A \leq f^o.B.B.f$, need $\forall b, b' \in B, \exists a \in A : a \subseteq f^o b b' f$
 Before that, uniform continuity of f along with Lemma 2.1.1 gives that
 $f.A \leq B.f \implies A = f^o f.A \leq f^o.B.f$
 So, fix $b, b' \in B$, now, as ,
 $A \leq f^o.B.f$ giving
 $\exists a \in A : a \subseteq f^o b f$ and $\exists a' \in A : a' \subseteq f^o b' f \implies \Delta_X \subseteq f^o b' f$.
 Therefore $a = a \Delta_X \subseteq (f^o b f)(f^o b' f) \subseteq f^o b b' f$
- (b) (i) (\implies) Let f be fully dense i.e. $B = f_*.f^* = B.f.f^o.B$. showing that $\forall b \in B, \exists b' \in B : b' \subseteq b f f^o b$:
 So, fix $b \in B$, as $B \leq B.f.f^o.B$, there exists $b' \in B$ such that $b' \subseteq b f f^o b$.
- (ii) (\impliedby) Suppose $\forall b \in B, \exists b' \in B : b' \subseteq b f f^o b$. This gives $B \leq B.f.f^o.B$, in order to show equality, also need $B \geq B.f.f^o.B$. By quasi-uniformity of B , for any $b \in B, \exists b' \in B : b' b' \subseteq b$. Now, by Lemma 2.4.2,

$$f f^o \subseteq \Delta_Y \implies b' f f^o b' \subseteq b' \Delta_Y b' = b' b' \subseteq b$$

- (c) (i) (\implies) Let f be topologically dense. We will show that for any $b \in B, y \in Y$, $(y, y) \in b f f^o b$. Fix any $b \in B$ and $y \in Y$. As f is topologically dense, $\overline{f(X)} = Y$, implying that $y \in \overline{f(X)}$, by definition giving that

$$\exists x \in X \text{ such that } (f(x), y) \in b \text{ and } (y, f(x)) \in b$$

Re-writing the above statement in terms of relations, and considering f as a relation:

$$(f(x), y) \in b \text{ gives } x(b \circ f)y \text{ i.e. } y \in (b \circ f)(x) \quad (7)$$

$$(y, f(x)) \in b \text{ gives } f(x) \subseteq b(y) \quad (8)$$

Repeatedly applying Lemma 2.4.3 to (2),

$$f(x) \subseteq b(y) \implies (f \circ f^o)(f(x)) \subseteq (f \circ f^o)b(y) \implies (f \circ f^o \circ f)(x) \subseteq (f \circ f^o \circ b)(y)$$

Applying Lemma 2.4.1 to the final inequality in the above statement gives that

$$f(x) = (f \circ \Delta_X)(x) \subseteq (f \circ f^o \circ f)(x) \subseteq (f \circ f^o \circ b)(y)$$

Applying Lemma 2.4.3 and then using (1) on the above inequality completes the result:

$$f(x) \subseteq (f f^o b)(y) \implies (b \circ f)(x) \subseteq (b f f^o b)(y) \implies y \in (b f f^o b)(y) \text{ i.e. } y(b f f^o b)y$$

- (ii) (\Leftarrow) Fix any $y \in Y$ and $b \in B$. Also, suppose that $\Delta_Y \leq bff^ob$. As f is a function with domain as X , $f^o : Y \rightarrow X$, $\phi \neq (f^o \circ b)(y) \subseteq X$. So, fix $x \in (f^o \circ b)(y)$, going to show that $(f(x), y) \in b$ and $(y, f(x)) \in b$. Again, while viewing f as a relation.

$$\Delta_Y \leq bff^ob \implies \Delta_Y(y) \subseteq bff^ob(y) = (bf)(f^ob(y))$$

Last inequality of the above statement gives $y \in (bf)(x)$ i.e. $(f(x), y) \in b$.
Applying Lemma 2.4.2 to f , and then using Lemma 2.4.4,

$$ff^o \subseteq \Delta_Y \implies ff^ob \subseteq \Delta_Y b = b$$

Thus $ff^ob(y) \subseteq b(y)$ and hence $f(x) \subseteq b(y) \implies (y, f(x)) \in b$

- (d) (i) (\implies) Let f be topologically dense. As B is a quasi-uniformity, for any $b \in B$,

$$\exists b' \in B : b'b' \subseteq b \text{ and } \Delta_Y \subseteq b' \implies b' = b'\Delta_Y \subseteq b'b' \subseteq b \quad (9)$$

By the characterisation of topologically dense in (c), have that $\Delta_Y \subseteq b'ff^ob'$. Now, using the (3) and Lemma 2.4.3,

$$\Delta_Y \subseteq b'ff^ob' \implies b' = b'\Delta_Y \subseteq b'b'ff^ob' \subseteq bff^ob' \subseteq bff^ob$$

Hence, we have $b' \in B : b' \subseteq bff^ob$ giving us that f is fully dense (from (b)).

- (ii) (\Leftarrow) From (b), we have for $b \in B$, the existstence of $b' \in B$ such that $b' \subseteq bff^ob$. As B is a quasi-uniformity, $\Delta_Y \subseteq b'$. So, $\Delta_Y \subseteq bff^ob$, and from (c), this gives us that f is topologically dense. \square

Definiton 3.8. The set PX is defined to be the collection of all promodules from the quasi-uniform space (X, A) to the quasi-uniform space 1.

$$PX := \{\psi : \psi : (X, A) \twoheadrightarrow 1 \text{ is a promodule}\}$$

Proposition 3.6. For any $a \in A$, \tilde{a} is defined to be a relation $PX \rightarrow PX$ as

$$\text{for } \phi, \psi \in PX, \phi \tilde{a} \psi \text{ only if } \phi \leq \psi.a$$

The set, $\tilde{A} := \{\tilde{a} : a \in A\}$ defines a quasi-uniformity on PX .

Proof. First need to show that \tilde{A} is a prorelation,

- (i) (Partial order) For any two relations $\tilde{a}, \tilde{b} : PX \rightarrow PX$, define $\tilde{a} \leq \tilde{b}$ to be true only if $a \subseteq b$.
(ii) (Down-Directed) Need for any $\tilde{a}, \tilde{b} \in \tilde{A}$, the existstence of some $\tilde{c} \in \tilde{A}$ such that $c \subseteq a, b$.
If $\tilde{a}, \tilde{b} \in \tilde{A}$ then there exist $a, b \in A$. By down-directedness of A , there exists a $c \in A$ such that $c \subseteq a, b$. Now the definition of \tilde{A} gives that $\tilde{c} \in \tilde{A}$. And the definition of the partial order on \tilde{A} ensures $\tilde{c} \leq \tilde{a}, \tilde{b}$.
(iii) (Upset) For any relation $l : PX \rightarrow PX$, need that if \tilde{k} belongs to \tilde{A} such that $l \geq \tilde{k}$, then $l \in \tilde{A}$.
Fix any $k : PX \rightarrow PX$, and $\tilde{k} \in \tilde{A}$ such that $l \geq \tilde{k}$. As k is a relation between promodules $X \twoheadrightarrow 1$, it can be thought of as a relation a on X , defined as:

$$a := \{(x, y) : x \in \text{domain}(\psi) \text{ and } y \in \text{domain}(\phi) \text{ whenever } \exists \psi, \phi \in PX : \psi l \phi\}$$

So, $l \geq \tilde{k}$ gives that $\tilde{a} \geq \tilde{k}$ i.e. $a \supseteq k$. And as A is an upper-set, we get $a \in A$. Now, by definition of \tilde{A} , $l \in \tilde{A}$.

Secondly, need show that the other two conditions hold for \tilde{A} ,

- (i) For all $\tilde{a} \in \tilde{A}$, need \tilde{a} to be reflexive i.e if $\psi \in PX$ then $\psi \tilde{a} \psi$.
By definition of \tilde{a} , need to show that $\psi \leq \psi.a$. So, fix a $p \in \psi$, we will show that $p \subseteq p.a$. Quasi-uniformity of A gives that $\Delta_X \subseteq a$. Hence, by Lemma 2.4.3, $p = p\Delta_X \subseteq p.a$.
(ii) For all $\tilde{a} \in \tilde{A}$, need to find $\tilde{b} \in \tilde{A}$ such that $\tilde{b}\tilde{b} \leq \tilde{a}$
Before showing the result, proving that for any $x, y \in A$, $\tilde{x}\tilde{y} \leq \tilde{x}\tilde{y}$ i.e. $\forall \psi, \phi \in PX, \psi(\tilde{x}\tilde{y})\phi \implies \psi\tilde{x}\tilde{y}\phi$. If $\psi_1(\tilde{a}.\tilde{b})\psi_3$, then, the definition of composition gives that $\exists \psi_2$ such that $\psi_1\tilde{b}\psi_2\tilde{a}\psi_3$. Now, the definition of \tilde{b} gives $\psi_1 \leq \psi_2.b$ and that of \tilde{a} gives $\psi_2 \leq \psi_3.a$. Combining these inequalities, $\psi_1 \leq \psi_2.b \leq \psi_3.ab$. Hence, by definition of ab , $\psi_1(ab)\psi_3$. Now, to show the result, fix any $\tilde{a} \in \tilde{A}$. Therefore, $a \in A$, and by quasi-uniformity of A , $\exists b \in A : b \circ b \subseteq a$. Thus, by the partial-order defined on \tilde{A} , $\tilde{b}\tilde{b} \leq \tilde{a}$. Now, transitivity of the partial order gives us the required result, $\tilde{b}\tilde{b} \leq \tilde{b}\tilde{b} \leq \tilde{a}$. \square

Proposition 3.7 (Yoneda Embedding).

For a quasi-uniform space (X, A) , function $y_X : X \rightarrow PX$ is defined by $x \mapsto x^*$ for $x \in X$.

- (a) $y_X : (X, A) \rightarrow (PX, \tilde{A})$ is a uniformly continuous map
- (b) $y_X : (X, A) \rightarrow (PX, \tilde{A})$ is fully faithful

Proof.

- (a) In order to show y_X is uniformly continuous, need to show that $y_X.A \leq \tilde{A}.y_X$. By definition of \leq , need $\forall a \in A, \exists b \in A : y_X \circ b \subseteq \tilde{a} \circ y_X$. Applying the relations to some element, x of the set X :

$$(y_X \circ b)(x) \subseteq (\tilde{a} \circ y_X)(x) \implies y_X(b(x)) \subseteq \tilde{a}(x^*) \quad (10)$$

So, for the condition given by (4) to hold, if $y \in b(x)$, then it's required that $y^* = y_X(y) \in \tilde{a}(x^*)$ i.e. $x^* \tilde{a} y^*$. Using the definition of x^*, y^* and \tilde{a} ,

$$x^* \tilde{a} y^* \iff x^o.A \leq y^o.A.a \iff \forall a' \in A, \exists a'' \in A : x^o a'' \subseteq y^o a' a \quad (11)$$

Now, fix any $a \in A, x \in X$. Thus, quasi-uniformity of A , gives $a'' \in A$ such that $a'' a'' \subseteq a$. Also, choose some $y \in a''(x)$. Hence, in order to show that the condition from (5) holds, need that $\forall b \in A, x^o a'' \subseteq y^o b a$, and by applying the relations to an element z gives the following condition

$$\forall b \in B, \forall x \in X, (x^o a'')(z) \subseteq (y^o b a)(z) \quad (12)$$

Examining the left side of (6),

$$(x^o a'')(z) = x^o(a''(z)) = \begin{cases} \phi & \text{if } x \notin a''(z) \\ \star & \text{if } x \in a''(z) \end{cases}$$

Thus, to show that (6) holds, need to show that (for any $b \in A$ and $z \in X$):

$$x \in a''(z) \implies z(y^o b a) \star \text{ i.e. } y \in (b a)(z) \quad (13)$$

To show that (7) holds, fix any $z \in X : x \in a''(z)$. Also, by our choice of y , have that $y \in a''(x)$. And as $b \in A$, it's reflexive, giving that $y \in b(y)$. So, by composition of relations, we get:

$$z a'' x, x a'' y \text{ and } y b y \implies z(a'' a'' b) y \implies z(a b) y \text{ i.e. } y \in (b a)(z)$$

- (b) By using Proposition 2.3(a), need to show that $A \geq y_X^o.\tilde{A}.y_X$ i.e. $\forall a \in A, \exists \tilde{b} \in \tilde{A} : a \supseteq y_X^o \tilde{b} y_X$. Applying to an element, $x \in X$ gives the condition

$$(y_X^o \tilde{b} y_X)(x) \subseteq a(x) \implies (y_X^o \tilde{b})(x^*) = y_X^o(\tilde{b}(x^*)) \subseteq a(x) \quad (14)$$

Thus, if $y^* \in PX$ such that $x^* \tilde{b} y^*$, then $y \in y_X^o(\tilde{b}(x^*))$. Now, for (8) to hold, $y \in a(x)$ i.e. $x a y$. Thus, need only to show that for any $a \in A, \exists b \in A$ such that $\forall x, y \in X, x^* \tilde{b} y^* \implies x a y$. So, fix $a \in A$, and take $b \in A : b b \subseteq a$. Now, let $x^* \tilde{b} y^*$ i.e. $x^o.A \leq y^o.A.b$. Hence, $\exists c \in A : x^o c \subseteq y^o b b$. And as c is reflexive,

$$x c x \implies x(c x^o) \star \implies x(b b y^o) \star \implies x(b b) y \implies x a y$$

□

Theorem 3.1 (Yoneda Lemma). *For every $\psi \in PX$, in the following digram,*

$$\begin{array}{ccc} X & \xrightarrow{(y_X)_*} & PX \\ & \searrow \psi & \downarrow \psi^* \\ & & 1 \end{array}$$

- (a) $\psi \geq \psi^*.(y_X)^*$
- (b) $\psi \in \overline{y_X(X)} \implies \psi \leq \psi^*.(y_X)_*$

Proof. (a) By definition, $(y_X)_* = \tilde{A}.y_X$, and $\psi^* = \psi^o.\tilde{A}$. Need that $\psi \geq (y_X)_*.\psi^* = \psi^o.\tilde{A}.\tilde{A}.y_X$. And applying Lemma 2.2.1 to \tilde{A} , the required condition becomes $\psi \geq \psi^o.\tilde{A}.y_X$. Fix $p \in \psi$, we will find $a \in A : p \supseteq \psi^o a y_X$. Examining the right side of the condition, (for any $a \in A, x \in X$)

$$(\psi^o.\tilde{a}.y_X)(x) = \psi^o.\tilde{a}(x^*) = \psi^o(\tilde{a}(x^*)) = \begin{cases} \phi & \text{if } \psi \notin \tilde{a}(x^*) \\ \star & \text{if } \psi \in \tilde{a}(x^*) \end{cases} \quad (15)$$

In case $\psi \notin \tilde{a}(x^*)$, the condition holds trivially. As ψ is a promodule, $\psi.A \leq \psi$ gives $\exists q \in \psi, a \in A : qa \subseteq p$. Thus, fix $x \in X$ and $\psi \in PX$ such that $x^* \tilde{a} \psi$. We will now show that $xp \star$. Using the definition of \tilde{a} ,

$$x^* \tilde{a} \psi \implies x^o.A \leq \psi.a \implies \exists b \in A : x^o b \subseteq qa \implies \forall z \in X, (x^o b)(z) \subseteq (qa)(z) \quad (16)$$

Thus, in particular for $z = x$, as b is reflexive, xbx , which gives:

$$(x^o b)(x) \subseteq (qa)(x) \implies x^o x \subseteq (qa)(x) \implies \star \in (qa)(x) \quad (17)$$

But, as $qa \subseteq p$, (11) gives that $xp \star$.

- (b) Suppose $\psi \in \overline{y_X(X)}$, need to show $\psi \leq \psi^*.(y_X)_* = \psi^o.\tilde{A}.y_X$ i.e. for $a \in A$, $\exists p \in \psi : p \subseteq \psi^o.\tilde{a}.y_X$. For any $x \in \text{domain}(p)$, the condition requires:

$$p(x) \subseteq \psi^o.\tilde{a}.y_X(x) = \psi^o(\tilde{a}(x^*)) \quad (18)$$

By definition of p , for (12) to hold, need that $xp \star \implies \psi \in \tilde{a}(x^*)$. Fix any $a \in A$, we will find $p \in \psi$ such that (12) holds. By quasi-uniformity of A , $\exists b \in A : bb \subseteq a$. From Proposition 2.5(a), y_X is uniformly continuous, $y_X.A \leq \tilde{A}.y_X$ giving that $\exists c \in A : y_X c \subseteq \tilde{b}y_X$. Thus, for any $z, w \in X$ such that $z c w$,

$$(y_X c)(z) \subseteq (\tilde{b}y_X)(z) \implies y_X(c(z)) \subseteq \tilde{b}(z^*) \implies w^* \in \tilde{b}(z^*) \text{ i.e. } z^* \tilde{b} w^* \quad (19)$$

As A is a quasi-uniformity, $\exists d \in A : dd \subseteq c$. Also, because A is a down-directed set, $\exists a' \in A : a' \subseteq b, d$. This along with (13) gives that for any $x, y \in X$

$$x(a'a')y \implies x(dd)y \implies xcy \implies x^* \tilde{b} y^* \quad (20)$$

Now, because $\psi \in \overline{y_X(X)}$, we get $\exists x^* \in y_X(X)$ such that $\psi \tilde{a} x^*$ and $x^* \tilde{a}' \psi$. By definition of \tilde{a} , $\psi \tilde{a} x^*$ gives

$$\psi \leq x^o.A.a' \implies \exists p \in \psi : p \subseteq x^o a' a' \quad (21)$$

Fix any $z \in X : zp \star$, using (15) and (14) gives:

$$zp \star \xrightarrow{\tilde{z}} (x^o a' a') \star \xrightarrow{(15)} z(a' a')x \xrightarrow{(14)} z^* \tilde{b} x^* \quad (22)$$

Finally, by definition of the partial order on $\tilde{A}, a' \subseteq b \implies \tilde{a}' \subseteq \tilde{b}$. Therefore, $x^* \tilde{a}' \psi \implies x^* \tilde{b} \psi$. Now, using (16), $z^* \tilde{b} x^*$ and $x^* \tilde{b} \psi$ gives the desired result $z^* \tilde{b} x^*$. \square

Corollary 3.1. For $\psi \in PX$, $\psi \in \overline{y_X(X)}$ if and only if ψ is a right-adjoint.

Proof. Fix any $\psi \in PX$.

(i) (\implies)

- (ii) (\impliedby) Suppose ψ is a right adjoint. Need to show that for any $a \in A$, $\exists x^* \in y_X(X)$ such that $\psi \tilde{a} x^* \tilde{a} \psi$. Fix $a \in A$. Because ψ is a right-adjoint, there exists a promodule $\phi : 1 \dashv \multimap X$ such that $\phi.\psi \leq A$ and $1 \leq \psi.\phi$. From $\phi.\psi \leq A$, we get that

$$\exists p \in \phi, q \in \psi \text{ such that } a \supseteq p.q \quad (1)$$

Because ϕ and ψ are promodules,

$$A.\phi \leq \phi \text{ gives the existence of } p' \in \phi \text{ such that } p \supseteq a' p' \quad (2)$$

$$A.\psi \leq \psi \text{ gives the existence of } q' \in \psi \text{ and } a'' \in A \text{ such that } q \supseteq a'' q' \quad (3)$$

Now, from $1 \leq \psi.\phi$, we get that $q' p'$ is reflexive i.e. $\star(q' p')\star$. By the definition of composition we get the existence of an $x \in X$ such that $\star p' x q' \star$. Now, considering x as a map, $x : 1 \rightarrow X$ defined as $\star \mapsto x$,

$$x q' \star \text{ i.e. } \star \in q'(x) \text{ gives that } q' \supseteq x^o \quad (4)$$

$$\star p' x \text{ i.e. } x \in p'(\star) \text{ gives that } p' \supseteq x \quad (5)$$

Thus, by using inequalities (1),(2) and (3), we get that

$$a \supseteq p q \supseteq a' p' q' a'' \quad (6)$$

By definition of \tilde{a} , to show $\psi \tilde{a} x^*$, we need that $\psi \leq x^* a = x^o.A.a$. Showing for any $b \in A$, $x^o b a \supseteq q'$:

$$x^o b a \supseteq x^o b a' p' q' \supseteq x^o b a' x q' \supseteq x^o x q' \subseteq q'$$

Where the first inequality comes from (6) by using reflexiviness of a'' and then left-multiplying by x° . The second inequality comes from (5), third one from reflexiviness of b and a' , and the last one is given by Lemma 2.4.1.

In order to show $x^* \tilde{a} \psi$, by definition of \tilde{a} , need that $x^\circ.A = x^* \leq \psi a$. Fix $k \in \psi$. We will show $ka \supseteq x^\circ a''$.

$$a \supseteq a' p' q' a'' \supseteq p' q' a'' \supseteq p' x^\circ a'' \quad (7)$$

Where the first inequality is given by (6), second one is due to reflexiviness of a' and the third inequality comes by using (4). Left-multiplying (7) with k gives

$$ka \supseteq k p' x^\circ a'' \quad (8)$$

FINAL STEP LEFT !!
